

IBM BOB HACKATHON · AWESOMBOB

CodeQuest Bob

Others explain code. CodeQuest Bob grows developers.

A repository-aware onboarding platform that turns unfamiliar codebases into quests, skill boosts, and a contribution-ready first PR package.

PackagePrepare the first PR

04

PassportRecord visible progress

WHY THIS MATTERS

New contributors do not need another code explainer.

They need a path from “I opened the repo” to “I can safely submit my first PR.”

- Repository context is scattered across files, docs, scripts, and conventions.
- Maintainers repeat setup, navigation, and first-task guidance.
- Progress disappears after the session unless it becomes a visible record.

Context

Where should I start?

Action

What is safe to do?

Ready

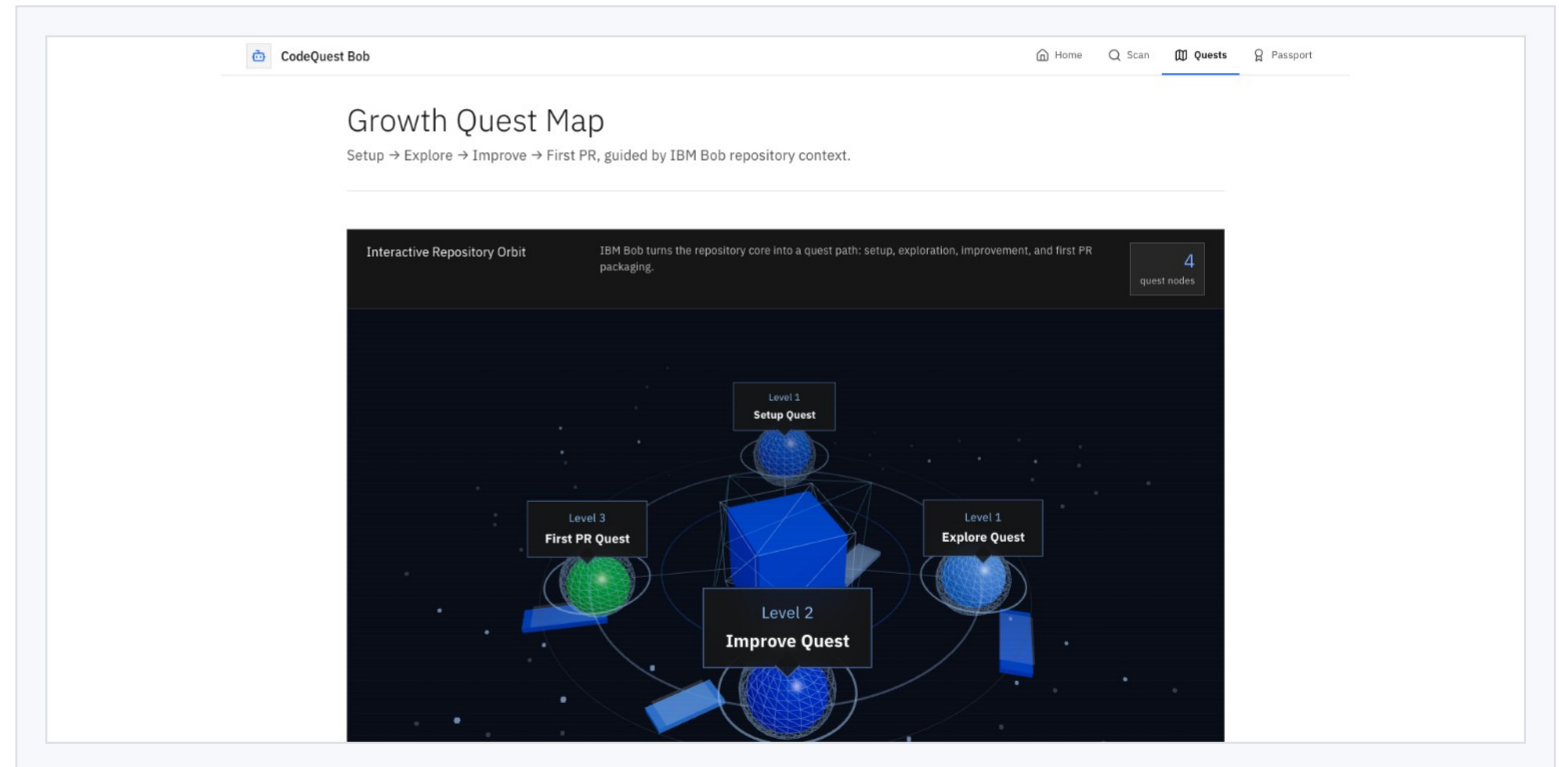

Can I submit a PR?

DEMO PATH

The quest map is the product's center of gravity.

- Repository intake creates the onboarding context.
- Quest Map turns that context into Setup, Explore, Improve, and First PR.
- Developer Passport records what the contributor learned and completed.

The demo path is simple: scan → quest → learn → package → record.

HACKATHON FIT

IBM Bob is the development partner, not a logo.

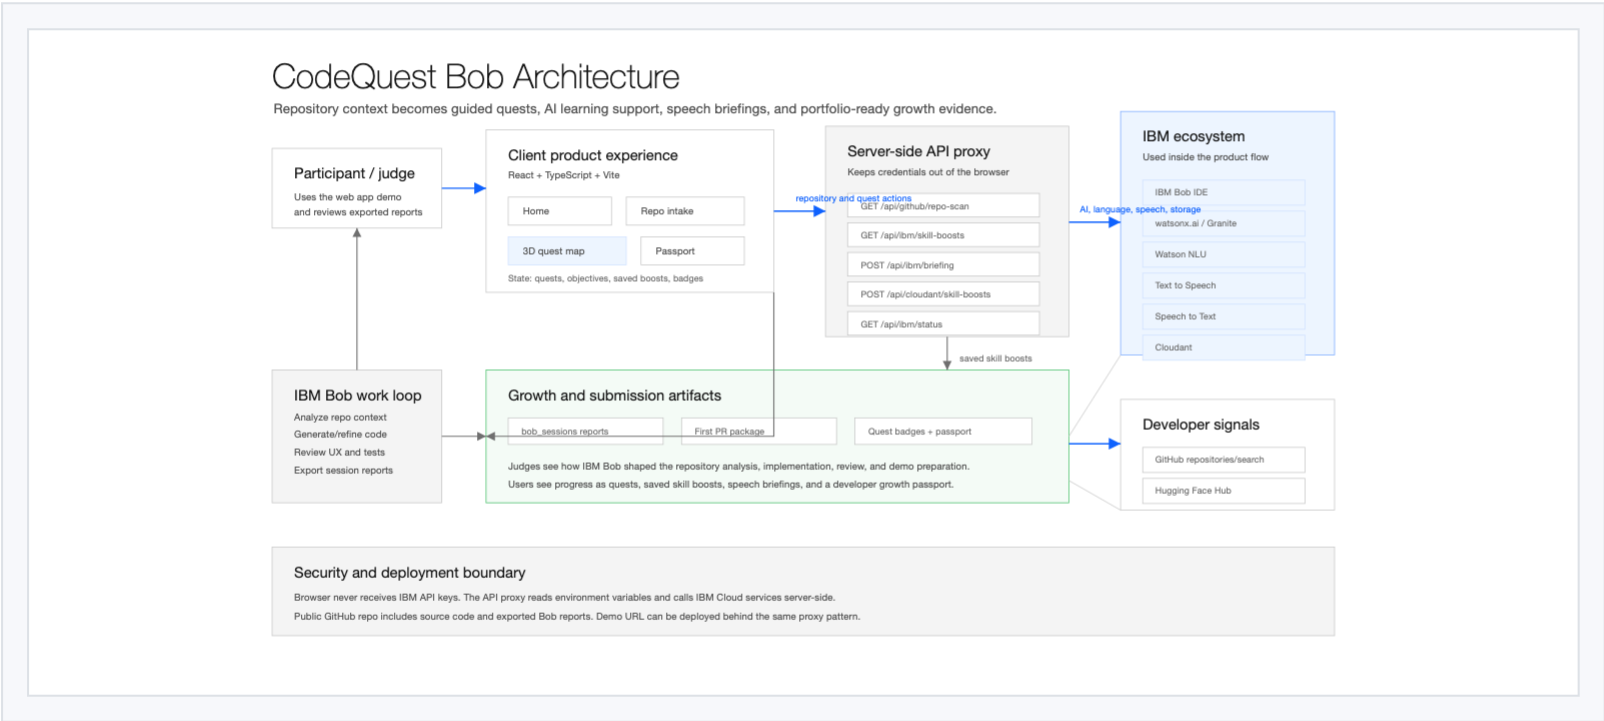

Required IBM Bob path

- Use IBM Bob IDE to analyze, plan, implement, and review.
- Export task/session reports into **bob_sessions/**
- Keep the GitHub repository public for judge review.
- Show how Bob shaped the project, not only the final UI.

Judging criterion	CodeQuest Bob answer
Application of Technology	Bob provides repository-aware development context and session reports.
Presentation	One demo path: intake → quests → first PR package → passport.
Business Value	Less onboarding friction, safer first PRs, less maintainer repetition.
Originality	Developer growth loop, not just a PR assistant.

SYSTEM DESIGN

Architecture keeps IBM AI powerful, but credentials out of the browser.

Client product

React screens show repository intake, quest map, Skill Boost Radar, First PR Package, and Passport.

Server-side proxy

IBM keys stay server-side. The browser calls product APIs, not raw IBM credentials.

IBM services

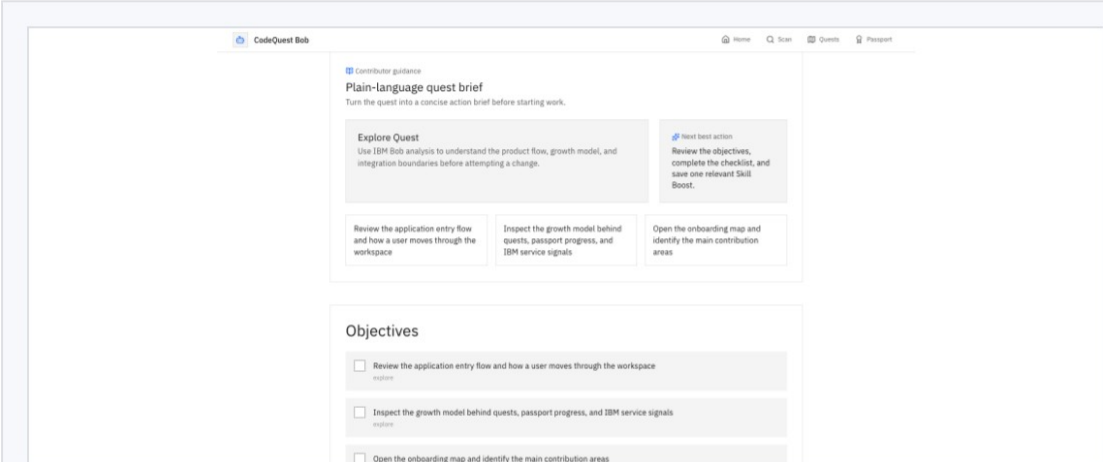

Granite, NLU, TTS, STT, Cloudant, and Bob session reports support the workflow.

Submission assets

Generated artifacts and exported Bob sessions make the IBM Bob workflow reviewable.

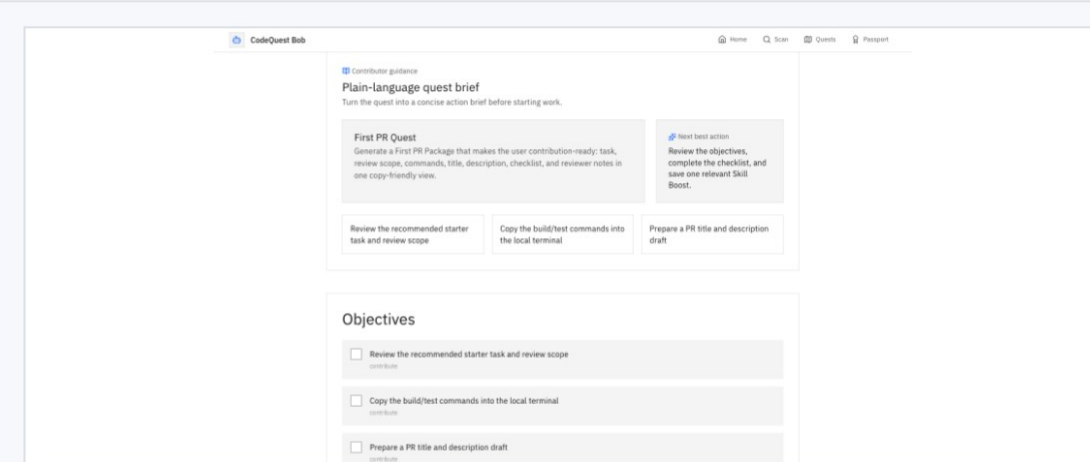

WHAT IS MEMORABLE

Two visible artifacts make the idea concrete.

Skill Boost Radar

Quest-specific learning recommendations from GitHub and Hugging Face signals, supported by IBM Granite and NLU.

First PR Package

A contribution-ready bundle with starter task, target files, commands, checklist, and reviewer notes.

This is the difference: CodeQuest Bob does not stop at explanation. It prepares action.

FINAL CHECKLIST

Submission is organized around the hackathon requirements.

Requirement	What we submit	Status
Basic information	Title, short description, long description, tags	Ready
Presentation	HTML-rendered pitch deck, PPTX, PDF	Ready
Video	Five-minute script and automated screenshots	Ready
Public GitHub	Project code plus exported Bob reports	Needs export
Demo URL	Deployed app URL from hosting platform	Next

Immediate next step: export Bob session reports, confirm public repo, deploy the app, then record the video.
